RstoxBuild

Package for building all Rstox packages

Description

This package contains functionality for building the Rstox packages (Rstox, RstoxFramework, RstoxData, RstoxECA, RstoxSurveyPlanner, RstoxTempdoc, and even RstoxBuild), and semi-automated testing of Rstox through test projects.

Details

The package defines titles, descriptions, dependencies, authors, install instructions and other info for all the packages. All changes to authors, descriptions, suggests and other outputs of the function `packageSpecs` should be changed in this package, and not in the individual packages. The package also contains functionality for semi-automated testing of Rstox on a set of test projects.

Author(s)

Maintainer: Arne Johannes Holmin <arnejh@hi.no>
